

Google SSO - login flow spec

Sprint 14 - Product space - demo attachment

Goal

Let people sign in with their Google account from the login page.

Flow

1. User clicks "Continue with Google" on /login.
2. Redirect to Google OAuth consent (openid, email, profile).
3. Callback verifies the ID token and finds or creates the user.
4. Existing email accounts are linked after a password check.
5. Session cookie is issued; redirect to the last opened list.

Acceptance criteria

- Works for new and existing accounts.
- Errors from Google show a friendly toast, never a blank page.
- Guest accounts can't be linked to Google.
